PT   Mutated alkaline cellulase for use as an enzyme for detergents is
PT   produced by deleting one or more amino acid residue groups from the 343-
PT   to 373-positions in SEQ ID No:1 and then inserting a peptide into the
PT   deletion site.

CC   The invention relates to a mutant alkaline cellulase derived from the
CC   Bacillus sp. KSM-S237 alkaline cellulase Egl-237 (ADE71407). The mutant
CC   enzyme is created by deleting one or more amino acid residues between
CC   residues 343-373 of the wild-type enzyme, and then inserting a 2-15
CC   residue peptide into the deletion site. The invention also encompasses a
CC   gene encoding a mutant alkaline cellulase of the invention, and vectors
CC   and host cells comprising a mutant alkaline cellulase-encoding gene. The
CC   mutant alkailine cellulases of the invention have an optimum pH which is
CC   very close to the pH of laundry water (around pH 10.5) and are therefore
CC   useful as enzymes for detergents. Sequences ADE71413-ADE71415 represent
CC   alkaline cellulases from other Bacillus species.

CC   The invention relates to an enzyme exhibiting endo-beta-1,4-glucanase
CC   activity (EC 3.2.1.4), comprising: (a) a polypeptide encoded by the DNA
CC   sequence appearing as ABX11841; (b) a polypeptide produced by culturing a
CC   cell comprising the DNA sequence under conditions where the DNA sequence
CC   is expressed; (c) an endo-beta-1,4-glucanase enzyme having at least 97%
CC   sequence identity to the amino acid sequence appearing as ABG76403; or
CC   (d) a polypeptide having endo-beta-1,4-glucanase activity that is encoded
CC   by a polynucleotide that hybridizes to the DNA under hybridisation
CC   conditions comprising 5X SSC at 45 plusoC and washing conditions
CC   comprising 2X SC at 60 plusoC. Also included are the encoding DNA
CC   sequence, a polynucleotide construct comprising any of the DNA sequence,
CC   an expression vector (comprising the following operably linked elements:
CC   a transcription promoter, a DNA segment encoding the enzyme and a
CC   transcription terminator), a cultured cell comprising the vector and
CC   expressing the enzyme, a method for degradation of cellulose-containing
CC   biomass that is treated with the enzyme or enzyme composition cited above
CC   and a hybrid endo-glucanase (exhibiting endo- beta-1,4-glucanase activity
CC   comprising the cellulase binding domain, CBD, of the enzyme , and a
CC   catalytic domain (CAD) from sources other than Bacillus sp. AA349 strain
CC   DSM12648). The enzymes are useful in detergent composition, textile
CC   finishing processes, oil industry, biomass degradation, laundry and stone
CC   washing. The invention provides enzymes having substantial beta-1,4-
CC   glucanase activity under slightly acid to alkaline conditions and
CC   improved performance in pulp processing, textile treatment, laundry
CC   processes, extraction processes or in animal feed. The present sequence
CC   represents the endo-beta-1,4-glucanase. (Updated on 23-OCT-2003 to

Since the glucose is the macromolecule which carried out the (beta)-1,4 connection linear, the conversion of a cellulose is possible for the fuel matter or a more nearly high-value-added metabolite with a degradation.
Therefore, as an enzyme which degrades a cellulose, research on an effective usage of cellulase and its reaction production is done variably.
Generally the cellulase used as these candidates for research has the optimal reaction pH into the in acidity, the enzyme derived from fungi or the anaerophyte which can degrade a crystalline cellulose good has taken the lead.

Unless alkali cellulase activity is lost, deletion of the amino acid in this amino acid sequence, substitution, or addition (it may call it variation hereafter) in particular is not limited.
Moreover, as for the amino terminus in the amino acid sequence of the mature enzyme shown in sequence number 1 or 2, one or more amino acids may be added, deleted or replaced.

【０００９】

本発明の配列番号１に示すアルカリセルラーゼ（以下、Ｎ１３１ａセルラーゼと表記する）のアミノ酸配列と従来公知のセルラーゼのアミノ酸配列との相同性を比較すると、Bacillus sp. No.1139 株の生産するセルラーゼ（Fukumoriら、J.Gen. Microbiol., 131, 3339-3345, 1985）との相同性は８１．９％であり、Bacillus sp. KSM-64 株由来のセルラーゼ（Sumitomoら、Biosci. Biotechnol. Biochem., 56, 872-877, 1992）との相同性は８３．６％、Bacillus sp. KSM-S237 株が生産するセルラーゼ（特願平１１－０１３０４９号）との相同性は８６．７％であり、本発明の遺伝子からコードされるＮ１３１ａセルラーゼと最も高い相同性を示したが、完全に一致するものではなかった。このことは、

When the homology of the amino acid sequence of alkali cellulase (it shows it as N131a cellulase hereafter) and the amino acid sequence of conventionally well-known cellulase which are shown in sequence number 1 of this invention is compared, the homology with the cellulase (Fukumori et al., J.Gen.Microbiol., 131, 3339-3345, 1985) which a Bacillus sp.No. 1139 strain produces is 81.9%.
The homology with the cellulase (Japanese Patent Application No. 11-013049) in which 237 strain of Bacillus sp.KSM-S produces the homology with the cellulase (Sumitomo et al., Biosci.Biotechnol.Biochem., 56, 872-877, 1992) derived from Bacillus sp.KSM-64 strain 83.6% is 86.7%.
The N131a cellulase coded from the gene of this invention and the highest homology were shown.
However, it was not what is completely in agreement.
This suggests that N131a cellulase is new alkali

Therefore, the amino acid sequence shown in sequence number 1 and the cellulase which has a maximum of 87 % or more homology are contained in this invention.

次に、本発明の配列番号２に示すアルカリセルラーゼ（以下、Ｎ１３１ｂセルラーゼと表記する）のアミノ酸配列と従来公知のセルラーゼのアミノ酸配列との相同性を比較すると、上記のＮ１３１ａセルラーゼとの相同性は８３．６％、Bacillus sp. No.1139 株の生産するセルラーゼとの相同性は８８．０％、Bacillussp. KSM-64 株由来のセルラーゼとの相同性は９０．９％であった。さらに、Bacillus sp. KSM-S237 株が生産するセルラーゼとの相同性が９４．７％と本発明の遺伝子からコードされるＮ１３１ｂと最も高い相同性を示した。このことは、Ｎ１３１ｂセルラーゼが従来公知のセルラーゼとは完全に一致するものではなく、新規な酵素であることを示唆するものであり、従って配列番号２に示したアミノ酸配列と最大９５％以上の相同性を有するセルラーゼは本発明に含まれる。尚、相同性の検索はＧＥＮＥＮＴＹＸ－Ｃ

Next, when the homology of the amino acid sequence of alkali cellulase (it shows it as N131b cellulase hereafter) and the amino acid sequence of conventionally well-known cellulase which are shown in sequence number 2 of this invention was compared, the homology with the cellulase derived from Bacillussp.KSM-64 strain of the homology with the cellulase which, as for the homology with the above-mentioned N131a cellulase, a Bacillus sp.No. 1139 strain produces 83.6% was 90.9% 88.0%.
Furthermore, the homology with the cellulase which 237 strain of Bacillus sp.KSM-S produces showed 94.7%, N131b coded from the gene of this invention, and the highest homology.
N131b cellulase of conventionally well-known cellulase does not correspond completely, and this suggests that it is a new enzyme.
Therefore, the amino acid sequence shown in sequence number 2 and the cellulase which has a maximum of 95 % or more homology are contained in this invention.

以上、ＫＳＭ－Ｎ１３１株は中性培地に生育しない好アルカリ性細菌であり、且つグラム陽性、カタラーゼ陽性の有胞子桿菌であることから、好アルカリ性バチルス属細菌であると判断された。そこで本菌株の形態学、生理学的性質について、Nielsenらが新たに分類した好アルカリ性バチルス属細菌の記載（Microbiology、141、1745-1761、1995）に準じ比較検討した結果、本菌株はバチルス　シュウドアルカロフィルスに近縁な菌種であると考えられた。しかし、その性質は既知のバチルス　シュウドアルカロフィルスと完全には一致せず、他のバチルス属菌の諸性質とも一致しないため、新規なバチルス属細菌として本菌株を工業技術院生命工学研究所へ、バチルス　エスピー　ＫＳＭ－Ｎ１３１株（ＦＥＲＭＰ－１７４７５）として寄託した。

As mentioned above, 131 strain of KSM-N is alkalophilic bacteriums which it does not grow to a neutral medium.
And since it was a gram-positive and catalase electropositive owner spore Bacillus, it was judged that they were alkali-loving Bacillus bacteria.
Then, Nielsen and others did comparison examination about the morphology of this-microbe strain, and a physiological characteristic according to publication (1745-Microbiology, 141, 1761, 1995) of the newly categorized alkali-loving Bacillus bacteria.
As a result, it was thought that this-microbe strain was a microbial species with close relation to a Bacillus shoed alcalophilus.
However, since it is not in agreement with a known Bacillus shoed alcalophilus and completeness and in agreement with the characteristics of several of another Bacillus genus, the characteristic is Bacillus sp to an institute-of-technology biotechnology research laboratory about this-microbe strain as new Bacillus bacteria.　It deposited as 131 strain (FERMP-17475) of KSM-N.

Example 6 (cloning by the genome PCR method of an N131b cellulase gene)
The sequence which was similar with the sequence of N131a cellulase when a cloning of N131a cellulase was performed is Bacillus sp. Possibility of existing on the genome of 131 strain of KSM-N was suggested.
Then, it compounds a primer 7-12 (sequence number 11-16) based on the amino terminus and middle amino acid sequence of S237 cellulase like the method used on the occasion of a cloning of an N131a cellulase gene, it performed amplification of the gene which codes N131b cellulase by PCR method.

Namely, Bacillus sp　It mixes ten micronL(s) each (0.3 micronM), buffer 10 micronL for PCR, 2.5 mMdNTP mix 8 micronL, deionized-water 60 micronL, and PwoDNA polymerase (made by Boehringer-Mannheim company) 1 micronL (5 unit) for the combination of genome solution 1 micronL (70 ng) of 131 strain of KSM-N, and a primer, after 94 degrees C and the thermal denaturation for 2 minutes, by 94 degrees C, it makes for 1 minute at 55 degrees C for 1 minute, and makes for 3 minutes into 1 cycle at 72 degrees C, it performed amplification of DNA on 30-cycle reaction conditions.

It purifies the acquired PCR production using High Pure PCR Product Purification Kit (made by a Boehringer-Mannheim company), 377DNA sequencer- each decided the base sequence.

The presence of the gene fragment considered to be the gene fragment and the stop codon, and its down-stream region of some which are considered to code the amino terminus of N131b cellulase or subsequent ones compared with a S237 cellulase gene in the base sequence of the obtained gene fragment was suggested.

However, the perfect base sequence was not acquired as a gene fragment about not deciding, the initiating codon, and the region of the vicinity.

First, it is Bacillus sp in order to acquire the gene which codes the upstream region from an amino terminus.　Various restriction enzymes (Sau 3A, EcoRI, HindIII) degrade genome-DNA 4 microgram of 131 strain of KSM-N, it made what was connected with the cassette using the LA PCR in vitro cloning kit

領域については遺伝子断片として取得されていなかった。まず、アミノ末端より上流の領域をコードする遺伝子を取得するためにバチルス　エスピー　ＫＳＭ－Ｎ１３１株のゲノムＤＮＡ４μｇを各種制限酵素（Ｓａｕ３Ａ、ＥｃｏＲＩ、ＨｉｎｄIII）により分解し、ＬＡ　ＰＣＲインヴィトロクローニングキット(宝酒造)を用いてカセットと連結したものを鋳型にＰＣＲ反応［プライマー１３（配列番号１７）及びプライマー１４（配列番号１８）を使用］を行った。その結果、ＨｉｎｄIIIにより処理したサンプルについてＤＮＡの増幅が認められ、この増幅断片（約０．４ｋｂ）の塩基配列を決定した結果、Ｎ１３１ｂセルラーゼのアミノ末端より上流の領域をコードする遺伝子断片が確認された。しかし、その解析を行うと開始コドンから３４塩基下流にアンバーコドン（ＴＧＡ）が存在することが明らかになった。アンバーコドン（ＴＧＡ）に関しては、枯草菌において極くまれにトリプトファンをコードするという報告もあることから（Lovett ら、J. Bacteriol.，173，1810-1812，1991)、本遺伝子においてもトリプトファンをコードする可能性が示唆された。しかし、開始コドンの上流部にはリボソーム

(Takara Shuzo) for the PCR reaction [primer 13 (sequence number 17) and primer 14 (sequence number 18) to the casting mould.

As a result, amplification of DNA is observed about the sample treated by HindIII, it decided the base sequence of this amplification fragment (about 0.4 kb(s)).

As a result, the gene fragment which codes the upstream region from the amino terminus of N131b cellulase was checked.

However, when the analysis was conducted, it became clear from the initiating codon that an amber codon (TGA) exists in 34 base downstream.

Since there is a report of coding the tryptophan rarely extremely in the Bacillus subtilis about an amber codon (TGA) (Lovett et al., J.Bacteriol., 173, 1810-1812, 1991), possibility of coding the tryptophan was also suggested in this gene.

However, a sequence required for the translation start of a ribosome binding site etc. was not discovered by the upper part of the initiating codon, but it also became clear that many ochre codons (TAA) exist.

Therefore, it was thought that this gene had high possibility of being the false gene which does not express in the cell.

In order to decide the base sequence which codes a perfect N131b cellulase gene, it used primer 15 (sequence number 19) and primer 16 (sequence number 20), and performed PCR reaction.

The base sequence eventually decided and the amino acid sequence presumed were shown in sequence number 2 and sequence number 4.

結合部位などの翻訳開始に必要な配列が見出されず、オーカーコドン（ＴＡＡ）がいくつも存在することも明らかになった。従って、本遺伝子は細胞内で発現しない擬似遺伝子である可能性が高いと考えられた。完全なＮ１３１ｂセルラーゼ遺伝子をコードする塩基配列を決定するためにプライマー１５（配列番号１９）及びプライマー１６（配列番号２０）を用いてＰＣＲ反応を行った。最終的に決定された塩基配列及び推定されるアミノ酸配列を配列番号２及び配列番号４に示した。

It purifies the N131b cellulase gene fragment and the upper expression region gene fragment which were obtained, recombinant PCR method performed amplification of DNA using primer 16 (sequence number 20) and primer 17 (sequence number 21).
It purifies the acquired chimera gene, it

connected with plasmid pHY300PLK (made by Yakult Honsha) treated beforehand at the same restriction enzyme after treatment by restriction enzyme BglII HindIII.
It introduces the obtained recombinant plasmid into 1214 strain of Bacillus subtilis ISW by the protoplast method, it performed transforming.
It carried out the shaking culture of the 30 degrees C of the transformant for 72 hours in PM medium (it set the tetracycline to 15 microgram(s)/mL).
The activity of the cellulase in the culture supernatant obtained by the centrifugation was about 33000 U/L.
